Ruby on Rails 5.x

Do início ao fim!

Comece criando o controller

rails g controller AdminsBackoffice/Subject

Altere o
 app/controllers/admins_backoffice/subjects_controller.rb

```
class AdminsBackoffice::SubjectsController <
AdminsBackofficeController
  before_action :set_subject, only: [:edit, :update, :destroy]

  def index
    @subjects = Subject.all.page(params[:page])
  end

  def new
    @subject = Subject.new
  end</pre>
```

```
def create
    @subject = Subject.new(params subject)
    if @subject.save
      redirect to admins backoffice subjects path, notice:
"Assunto/Área cadastrado com sucesso!"
    else
     render : new
    end
  end
  def edit.
  end
```

```
def update
   if @subject.update(params subject)
      redirect to admins backoffice subjects path, notice:
"Assunto/Área atualizado com sucesso!"
    else
     render :edit
    end
  end
  def destroy
    if @subject.destroy
      redirect to admins backoffice subjects path, notice:
"Assunto/Área excluído com sucesso!"
   else
     render :index
    end
  end
```

```
def params_subject
   params.require(:subject).permit(:description)
end

def set_subject
   @subject = Subject.find(params[:id])
end
end
```

 Altere o menu, adicionando mais um item em app/views/layouts/admins_backoffice.html.erb

```
<%= link_to '#' do %>
<i class="fa fa-file-text-o fa-fw"></i> Assuntos/Áreas
<% end %>
```
